The Price of Survival is a new report that takes a comprehensive look at the economic, social, and environmental costs of climate change. The report finds that the costs of climate change are already significant and are only going to increase in the future.

## The Economic Costs of Climate Change

The economic costs of climate change are vast and far-reaching. They include:

- **Extreme weather events:** Climate change is leading to more extreme weather events, such as hurricanes, floods, droughts, and heat waves. These events can cause widespread damage to infrastructure, homes, and businesses, and can lead to loss of life.
- **Sea level rise:** Climate change is causing sea levels to rise, which is threatening coastal communities and infrastructure. Sea level rise can lead to flooding, erosion, and salinization of freshwater sources.
- **Changes in agricultural yields:** Climate change is affecting agricultural yields, making it more difficult for farmers to grow crops. This can lead to food shortages and higher food prices.
- **Health impacts:** Climate change is having a negative impact on human health. Extreme heat, air pollution, and other climate-related hazards can cause a variety of health problems, including heat stroke, respiratory problems, and cardiovascular disease.

## **The Social Costs of Climate Change**

The social costs of climate change are just as significant as the economic costs. They include:

- **Displacement:** Climate change is displacing people from their homes and communities. Rising sea levels, extreme weather events, and other climate-related hazards are forcing people to relocate, often to areas that are less hospitable.
- **Conflict:** Climate change can lead to conflict and instability. Competition for scarce resources, such as water and land, can lead to conflict between communities and countries.

- **Mental health impacts:** Climate change can have a negative impact on mental health. Extreme weather events, displacement, and other climate-related stressors can lead to anxiety, depression, and other mental health problems.

## **The Environmental Costs of Climate Change**

The environmental costs of climate change are also significant. They include:

- **Loss of biodiversity:** Climate change is leading to the loss of biodiversity. Rising temperatures, changes in precipitation patterns, and other climate-related factors are harming plants and animals, and are leading to the extinction of some species.
- **Ocean acidification:** Climate change is causing the ocean to become more acidic. This is harmful to marine life, and can damage coral reefs and other marine ecosystems.
- **Melting glaciers and sea ice:** Climate change is causing glaciers and sea ice to melt. This is leading to a rise in sea levels, and can disrupt ecosystems and livelihoods.

## **The Need for Collective Action**

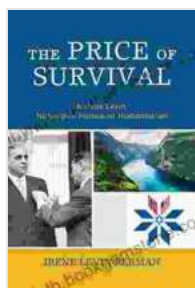

The Price of Survival makes it clear that the costs of climate change are already significant and are only going to increase in the future. It is urgent that we take collective action to address climate change and mitigate its impacts.

There are a number of things that we can do to address climate change, including:

- **Reduce our greenhouse gas emissions:** We need to reduce our greenhouse gas emissions, which are the main cause of climate change. We can do this by switching to renewable energy sources, improving energy efficiency, and reducing our reliance on fossil fuels.
- **Adapt to the impacts of climate change:** We need to adapt to the impacts of climate change that are already happening. This includes investing in flood defenses, drought-resistant crops, and other measures to protect our communities and infrastructure.
- **Support climate justice:** We need to support climate justice, which means ensuring that the burdens of climate change are shared fairly. This includes providing financial assistance to developing countries that are particularly vulnerable to the impacts of climate change.

The Price of Survival is a wake-up call. It shows us that the costs of climate change are already significant and are only going to increase in the future. It is urgent that we take collective action to address climate change and mitigate its impacts.

We have the knowledge and the resources to address climate change. What we need now is the political will and the public support to make it happen.
